Mean 17.907; Variance 61.592; scale 0.291 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Disclosure: Page 5: 77pp: English.

The present sequence represents an analogue, MCP-1 (10-76), of monocyte chemotatractent protein-1 (MCP-1). The analogue, which lacks the chemotatractent protein-1 (MCP-1). The analogue, which lacks the chemotal amino acids 1-9 of MCP-1, acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 creeptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding diseases. The analogue competes more effectively with MCP-1 for binding providing 50% inhibition of binding at a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND. N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) lacks MCP-1 activity and inhibits receptor binding, useful as anti-inflammatory agent Monocyte chemoattractant, protein analogue MCP-1 (10-76).

The present sequence represents an analogue, MCP-1 (11-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the N-terminal amino acids 1-10 of MCP-1, acts as an antagonist of MCP-1 as t lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases. MCP-1 has been implicated in allergic and chronic inflammatory diseases. The analogue competes more effectively with MCP-1 for binding diseases. The analogue competes more effectively with MCP-1 for binding with 75:1 for prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

Notice that they inhibit the monocyte chemo-attractant activity of apable of inhibiting the monocyte chemo-attractant activity of the monocyte chemo-attractant activity of apable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis.

For an analysis of an activity of endogenous monocyte chemoattractant activity of endogenous monocyte chemoattractant activity of endogenous concern they inhibit the monocyte chemoattractant activity of endogenous concern they inhibit the monocyte chemoattractant activity of endogenous concern they inhibit the monocyte chemoattractant activity of endogenous concern they inhibit the monocyte chemoattractant activity of endogenous concerns they inhibit the monocyte chemoattractant activity of endogenous concerns concerns and collider in a preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino acids 2-8. The present sequence is a specifically claimed Monocular and Cellular Biology, vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients undergoing coronary artery angioplasty.
N-terminal amino acids 1-8 of MCP-1, acts as an antagonist of MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory alseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with MCP-1 for binding with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                    ö

Mean 23.018; Variance 24.711; scale 0.932 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an analogue, MCP-1 (8-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the as in lacks MCP-1 biological activity and inhibits binding to a MCP-1 creeptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases. MCP-1 has been implicated in allergic and chronic inflammatory diseases. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding C mCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably providing 50% inhibition of binding at a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis claim 3; Page 11; 22pp; English (MCP-1) derivatives are mutated such monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such monocyte chemoattractant activity of endogenous MCP-1, provided that the monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Landon and/or 30-Arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 37-Asp by Ala; and/or (4) deletion of amino acidis. 2-8 The present sequence is a specifically claimed human MCP-1 derivative based on the parent protein disclosed in Rollins, Molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Tyr in the native sequence is replaced by Asp"

26 Claim 1, Page 3; 6pp; German

27 Executed with a polyclaid appropriate was used to prepare a cDNA in the expression vector lambda gtil. 1.5 x 10(5) GDNA clones were considered with a polyclanal anti-P6 antiserum of monospecific and munoglobulin G and Six positives were identified. The insert of a immunoglobulin G and Six positives were identified. The insert of a cuitable cDNA clone, pH42, was cloned into pUG18 and sequenced. Chemoattractant (bMCP-1), which is a homologue of human (h)MCP-1. Chemoattractant (bMCP-1), which is a homologue of human (h)MCP-1. Peptide Showing 100% and the central region showing 89% homology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-03N-1993 (first entry)
28-03N-1993 (first entry)
Sequence of bovine P6 protein.
Monocyte chemostractant; bovine P6-derivative; thrombosis; tumour;
inflammation therapy.
and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989. The peptides can be used to prevent restenosis, e.g. in patients undergoing coronary artery angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein; antisense; inhibition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are capable of inhibiting the monocyte chemo-attractant activity of morphogenous MCP-1 and can be used to treat restenosis claim 6; Page 11; 22pp; English.

Monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous CPP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate, (2) substitution of 24 Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino derivative based on the parent protein disclosed in Rollins, Molecular Cand Callular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients Squence 76 Aa;
                                                                      Anti-sense Monocyte Chemotactic Protein-1 oligo:nucleotide(s) -
useful for therapy or diagnosis of restenosis, etc.
Useful for therapy or diagnosis of restenosis, etc.
Disclosure: Column 13-14; 16pp; English.

This is the amino acid sequence of the human monocyte chemoattractant
protein (MCP)-1, a member of the C-C chemokine family. MCP-1 is a potent
stimulator of monocyte chemotaxis and is produced by injured vascular
smooth cells thus attracting monocytes. The general infiltrate
the injured area and release growth factor. This causes proliferation of
the vascular smooth cells resulting in restenosis. The gene sequence can
be used to generate antisense sequences e.g. 148093-7, which can be used
to inhibit in vitro MCP-1 prodn. by mononuclear cells e.g. lymphocytes or
macrophages, or smooth muscle cells, esp. in order to prevent vascular
                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               'note= "Asp in the native sequence is replaced by Ala"

MCPs can be isolated from human glioma cell line U-105MG (e.g. present sequence) and peripheral blood monouclear leukocytes. MCPs are used for the treatment of neoplasms and infections in humans. Short peptides derived from MCPs can be screened to identify chance that can bind to the monocyte receptor without stimulating a chance to response. These are potentially useful for treating a inflammation associated with monocyte infiltration.

The peptides can be used to prevent restenosis, e.g. in patients cundergoing coronary artery angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wound treatment using monocyte chemotactic factor - has potent therapeutic effect on skin wounds and ulcers
Disclosure; Page 12; 22pp; Japanese.
The invention relates to a new remedy for curing wounds which, instead of comprising a growth factor, comprises a monocyte chemotactic activating factor (MCAF) or its variants or derivatives. The factor has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ő

oligonucleotides may be labelled with a radionuclide and use therapeutically for the treatment of vascular restenosis. Radiolabelled antisense MCP-1 compounds may be constructed using high energy alpha or beta emitting isotopes rather than the gamma emitters cutomarily used for diagnostic purposes. Antisense MCP-1 compounds inactivate MCP-1 or inhibit production of MCP-1 so that proliferation of vascular cells is inhibited.
                                                                                                                                                                                                                                                                    0; Gaps

The present sequence represents an analogue, MCP-1 (8-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1), acts as an antagonist of MCP-1 of MCP-1, acts as an antagonist of MCP-1 ceptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into cinflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding CMCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably providing 50% inhibition of binding at a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND.
                                       rruncated monocyte chemoatrractant protein 1; inhibitor; receptor binding; anti inflammatory; basophil; lymphocyte; allergy; chronic inflammatory disease; arthritis; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) lacks MCP-1 activity and inhibits receptor binding, useful as anti-inflammatory agent
Monocyte chemoattractant protein analogue MCP-1 (8-76).

Poly(A+) RNA from buil seminal vesicles was used to prepare a cDNA in the expression vector lambda gill. 1.5 x 10(5) cDNA clones were screened with a polyclonal anti-P6 antiserum of monospecific immunoglobulin g and six positives were identified. The insert of a sultable cDNA clone, pH42, was cloned into pUC18 and sequenced. PH42 encodes the 11,114 Da precursor of P6. It is called Monocyte Chemoattractant (bMCP-1), which is a homologue of human (h)MCP-1. There is 72% overall AA sequence homology to hMCP-1 with the signal peptide showing 100% and the central region showing 89% homology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Poly(A+)RNA from bull seminal vesicles was used to prepare a cDNA in Poly(A+)RNA from bull seminal vesicles was used to prepare a cDNA in the expression vector lambda gill. 1.5 x 10(5) cDNA clones were screened with a polyclonal anti-P6 antiserum of monospecific lamnoglobulin G and 3ix positives were identified. The insert of a suitable cDNA clone, pH42, was cloned into pUCI8 and sequenced. PH42 encodes the 11,114 Da precursor of P6. It is called Monocyte Chemoatractant (bMCP-1), which is a homologue of human (h)MCP-1. There is 72% overall AA sequence homology to hMCP-1 with the signal peptide showing 100% and the central region showing 89% homology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                          28-JAN-1993 (first entry)
Sequence of bovine P6 protein.
Monocyte chemoattractant; bovine P6-derivative; thrombosis; tumour;

Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis
Claim 3: Page 11: 22pp; English.
Monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 3-Arg by Ala; and/or (4) deletion of al Arg by Phe; (3) substitution of 3-Arg by Ala; and/or (4) deletion of anno acids 2-8. The present sequence is a specifically claimed human MCP-1 derivative based on the parent protein disclosed in Rollins, Molecular

Rollins B, Zhang YJ; WPI; 95-215051/28.

FEBS LETT. 395.277-282(1996)
-!- FEBS LETT. 395.277-282(1996)
-!- FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES AND BASOPHILS
BUT NOT NEUTROPHILS OR EOSINOPHILS. AUGMENTS MONOCYTE ANTI-TUMOR ACTIVITY. HAS BEEN IMPLICATED IN THE PATHOGENESIS OF DISEASES CHARACTERIZED BY MONOCYTIC INFILTRATES, LIKE PSORIASIS, RHEUMATOID ARTHRITIS OR ATHEROSCLEROSIS. MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL WALL DURING THE DISEASE PROCESS OF ATHEROSCLEROSIS.
                                                                                                                                                                                       -:- SUBUNIT: MONOMER OR HOMODIMER; IN EQUILIBRIUM.
-!- PTM: PROCESSING AT THE N-TERMINUS CAN REGULATE RECEPTOR AND TARGET CELL SELECTIVITY. DELETION OF THE AMINO- TERMINAL RESIDUE CONVERTS IT FROM AN ACTIVATOR OF BASOPHIL TO AN EOSINOPHIL CHEMATTRACTANT.
-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MISSING: LOSS OF ACTIVITY.

"Induction of monocyte chemoattractant protein-1 in the small veins

of the ischemic and reperfused canine myocardium.";

CIRCULATION 95:693-700(1997).
                                                                                                                                                                                                                               NEUTROPHILS. IMPORTANT FACTOR IN THE COURSE OF THE INFLAMMATORY REACTION TO REPERFUSION OF THE PREVIOUSLY ISCHEMIC MYCOARDIUM.
MAY PLAY A SIGNIFICANT ROLE IN MONOCYTE TRAFFICKING INTO THE SEPERFUSED MYCOARDIUM.
SUBUNIT: MONOMER OR HOMODIMER; IN EQUILIBRIUM (BY SIMILARITY).
INDOCTION: BY THE ALBHA.
TISSUE SPECIFICITY: ENDOCHELIUM OF SMALL VEINS AND INTRAFASCICULAR VEINS, AND INFLIFRATING LEUROCYTES.
SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

lipopolysaccharide-stimulated rat macrophages in culture.";
BIOCHEM. BIOPHYS. RES. COMMUN. 220,945-948(1996).
-! FUNCTION: MONORINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.
HAS CHEMOTACTIC ACTIVITY FOR MONOCYTES, NEUTROPHILS, EOSTNOPHILS,
PRODUCTION, NEUTROPHIL RECRUITMENT AND SUBSEQUENT LUNG IN-LICHA
MAY FUNCTION AS AN AUTOCRINE MEDIATOR FOR THE MACROPHAGE
ADHESION WOLECULES REQUIRED FOR NEUTROPHIL INFLUX. THIS PROPIEIN
                                                                                                                                            INDUCTION: BY LIPOPOLXSACCHARIDE (LPS).
SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                  MACROPHAGE INFLAMMATORY PROTEIN 1-ALPHA.
